2022-2024 Porsche Macan S and GTS Front Radiator Grille Installation Procedure

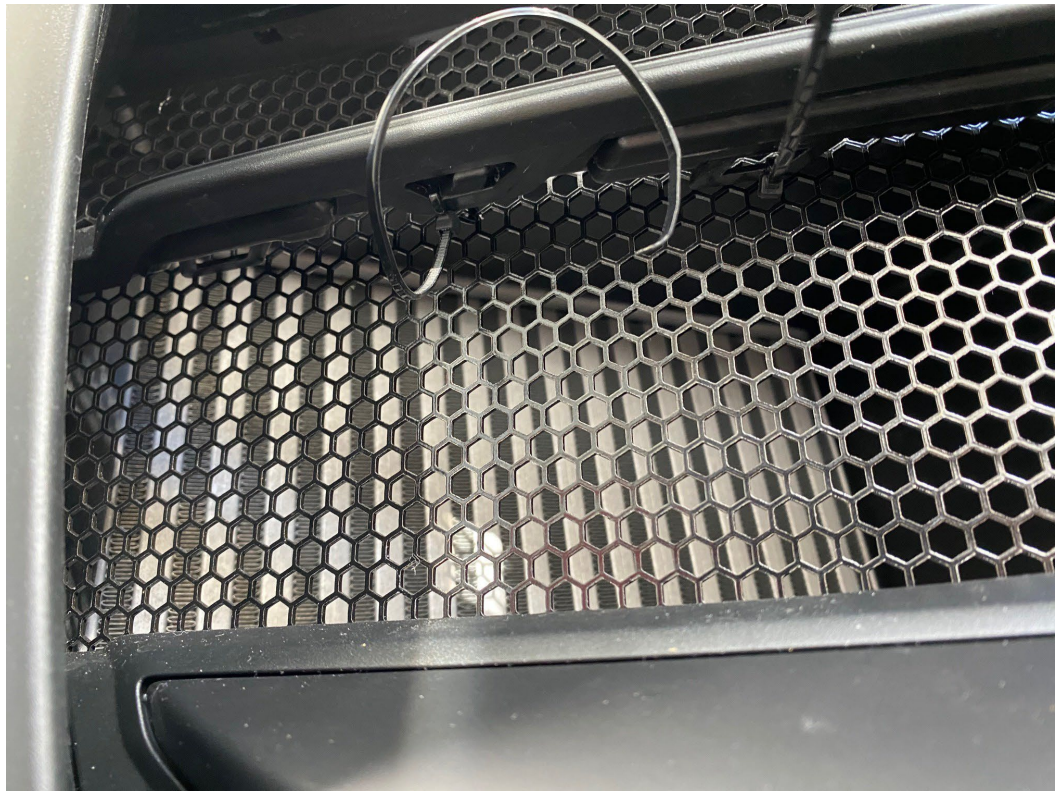

i Note: it is best to protect your paint with painter's tape during the installation procedure.

Procedure

1. The first order of business is to make sure you have all of the tools and parts necessary to start the project. The hexagon mesh pattern is directional, use whichever side you like facing forward. There are extra cable ties, please use these by looping them together to give yourself grip to pull and rotate that grille into position. You will cut these away once the hidden cable ties are secured.
2. Cover all exposed areas with painters' tape, the edges are sharp and can damage the paint.
3. Insert the grille in through the top opening, flatter end first, with the pointed end upwards. Insert into the cavity.
4. Utilizing the looped cable ties, rotate the grille into position. The grille will want to catch on things, it may require slight bending to get the grille into final position. You will find that the left and right inner duct areas are flexible. Use this to your advantage and you can gently press the ducting out of the way to start rotating the grille into position. Push, then rotate slightly, push more then rotate more.
5. Once in position, loop the installed open ended cable ties through the small opening in the trim clips. The most outer cable tie can be looped around the entire horizontal bar as it is mostly hidden.

6. The last cable tie towards the exterior of the vehicle on each side can be simply wrapped around the horizontal bar as far back as you can. Rotate the receiving ends as far underneath the horizontal bar as you can just before the final tightening. Then clip off the ends. Done!
